

Phonocardiogram

Info

The Coala Phonocardiogram (PCG) viewer displays the correlation of the recorded chest ECG and the heart sound. It is a digital tool that interprets several different frequencies of the heart sound, using a selected portion of the chest ECG as basis to identify S1 and S2. The information in the framed boxes can be used as basis to identify systolic noise disturbances such as murmurs. The Coala Phonocardiogram viewer shall not be used as sole base of diagnosis and is solely a viewer for screening and aiding detection.
